superteam

Cyber Defense: Zero Day

A free tower defense with perks for holders

Play-to-earn turns a game into a faucet

- When playing mints the token, bots farm it and players sell it.
- Token gates and entry passes put a purchase before the first minute of play.
- When the payouts drop, there is no game left worth staying for.

Existing players solving it… but poorly

P2E — Play-to-earn games

- ✓ Players really own what they earn.
- ✗ Play mints the token, so bots farm it and rewards get sold.
- ✗ When payouts fall, the players leave.

NFT — NFT-gated games

- ✓ No faucet: assets are bought, not minted by play.
- ✗ A purchase comes before the first minute of play.
- ✗ Free players stay outside, so the audience stays small.

TD — Classic tower defense

- ✓ A proven loop: free, instant, fun within a minute.
- ✗ Skins and progress stay locked in one publisher's account.
- ✗ Nothing the player holds matters outside the game.

Here’s how our approach stands out...

- Hold, don't farm: the game never mints or pays out $ZDAY. Nothing to bot, nothing to dump.
- Free first: the whole game plays with zero tokens. One wallet signature, no transaction.
- Perks follow the wallet: 25, 50 and 100 $ZDAY switch on two tower skins and a +20% head start, and switch off within the hour once you sell.

Introducing

Cyber Defense: Zero Day

Live and free to play in the browser: 6g9ip66h.idos.games

Making it happen (Use-cases)

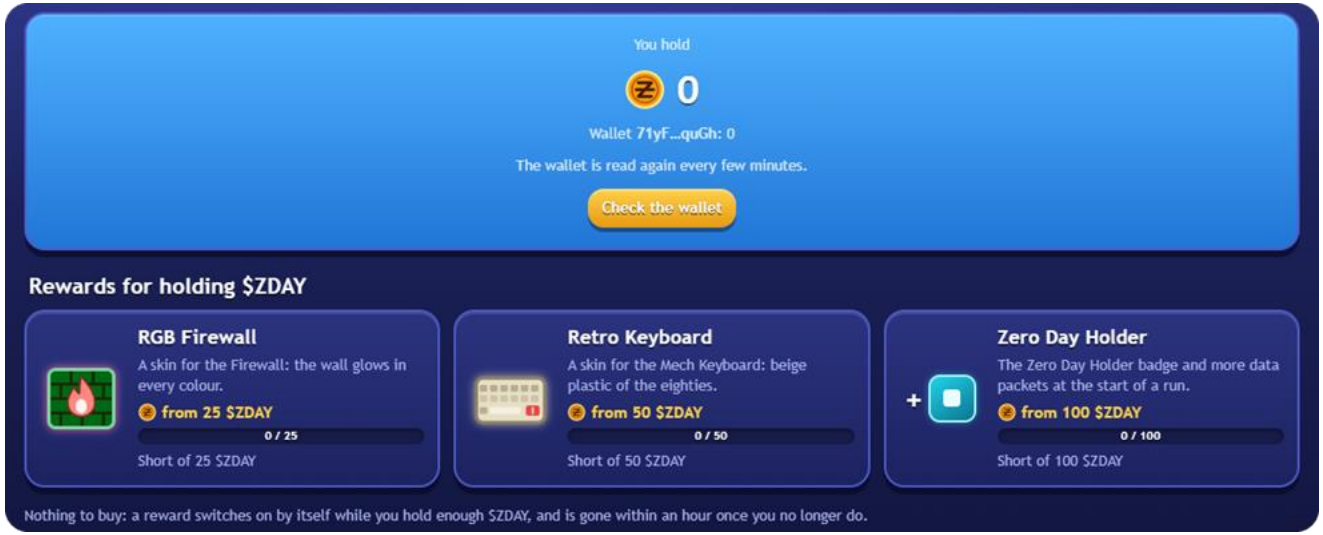

Current	Near Future	Distant Future
Play a full run for free, right in the browser	Holding verified on the server, not in the browser	New towers, viruses and holder-only skins
Sign in with a Solana wallet: one signature, no transaction	Wallet sign-in on phones	Seasonal leaderboards and events
Hold 25 / 50 / 100 $ZDAY for two skins and a +20% start	Playtests with real players, then a balance pass	Hold-to-unlock as a module for other iDos Games titles
Climb the global best-run leaderboard		

Built and live. Players come next.

5
towers and 2 virus types

3
hold tiers

0
tokens paid out by the game

The hold rewards screen of the live build, signed in with a test wallet that holds 0 $ZDAY.
Not proven yet: retention and revenue. There is no player data so far.

Why now?

The pieces finally fit in one browser tab

No studio, no backend team, no publisher: one developer shipped it.

- Wallet sign-in is a single signature: no transaction, no fee.
- A browser can read a token balance straight from Solana mainnet.
- iDos Games provides accounts, leaderboards, timed boosts and hosting.
- AI coding agents let one person build, test and publish in days.

Why am I the one to do it?

- Solo developer: game design, code, token wiring and publishing, end to end.
- Shipped a live, open-source MVP in days, working with an AI coding agent.

Here is how we will make money...

$0	0	3
revenue today: the game is free	$ZDAY minted by the game	hold tiers: 25, 50, 100 $ZDAY

- Today: no revenue. The game is free and sells nothing; holding $ZDAY only unlocks perks.
- Plan: optional premium cosmetics and season content in the in-game store. Hold perks stay free.
- Not validated: pricing and willingness to pay are open questions for the first playtests.

Where will we be next year if we win the hackathon?
